Commercial Solar Inspection & Maintenance:

Dear Client,

Is your solar system working as hard, and as safely, as it should be?

Most commercial solar systems are installed and then left alone. Monitoring screens can look fine while output slowly drops, or while faults develop that nobody can see from the ground. Loose connectors, damaged cabling, failing isolators and corroded fixings can lead to lost production, costly shutdowns and, in the worst cases, fire.

Apex Electrics designs and installs commercial solar, so we know where these systems fail. Our inspection and maintenance service helps you:

- **Find safety hazards early.** We inspect panels, racking, cabling, isolators, switchboards, and inverters, and use infrared thermal imaging to spot overheating connections and failing components.
- **Recover lost output.** Cleaning and shading checks, along with a review of underperforming strings and your monitoring data, can return energy you are already paying for.
- **Protect your investment.** A documented service history supports warranty and insurance requirements and helps your system last.

You receive a clear written report with photos and thermal images, with every finding ranked by urgency. Any repairs are quoted separately, and there is no obligation to use us for the work.

I would like to offer you a **free phone consultation** to discuss what your system needs. Please call me on 0433185756 or email Kane@apexelectrics.com.au to arrange a time that suits you.

Kind regards,

Kane Hibberd
